ACKNOWLEDGEMENT

This Anthropometric Nutrition & Mortality SMART Survey was supported by Mr. Hassan Ali Ahmed ACF Nutrition Surveillance Expert, Dr. Baidar Bakht Habib, ACF SMART Program Manager and Dr. Shafiullah Samim ACF SMART DPM.

Action Contre la Faim (ACF) would like to recognize efforts made by the following persons and institutions towards the successful implementation of this survey in Kuner Province of Afghanistan.

- United Nations office for coordination and humanitarian affairs Common Humanitarian fund (UNOCHA- CHF) OCHA for their financial support.
- The Ministry of Public Health (MoPH) and particularly the Public Nutrition Department, for their collaboration in this project
- The Nutrition Cluster for their support
- Première Urgency - Aide Medical International (PU-AMI) for the dedicated field work, especially their team in Kuner and Kabul; Dr. Abdullah Rawan, Liam Kelly, Dr. Ehsanullah Anwari, Dr. Mohammad Agha Nawabzai, Dr. Tela Mohammad Sherzad and Abdul Wali Sahibzai.
- The entire survey teams for their effortless commitments and hard working in undertaking quality data collection last but not least tremendous appreciation goes to the Kuner PNO for their supports and authorization of the survey.
- The household respondent for their unconditional cooperation for providing information and availing their children for anthropometric measurements.
- ACF Kabul and Paris team for their technical and logistic support.

EXECUTIVE SUMMARY

Kunar is one of the 34 provinces of Afghanistan, located in the northeastern part of the country. It has 15 districts: Bar Kuner, Chapa Dara, Dan gam, Dara I Pech, Ghazi Abad, Khas Kuner, Naran Aw Badil, Marwera, Nari, Nor gal, Sawkai, Shaegal, Sarkani, Wata poor and capital is Asadabad.

The overall objective of the survey was to evaluate current nutritional status of vulnerable population living in Kuner Province and levels of possible contributing health and WASH factors. However, the survey has covered 5 districts, but covering 41 % (around **428,800**) of the overall province population, as the remaining, mostly low populated mountainous districts were classified as inaccessible due to insecurity. The covered districts were namely Wata Poor, Asmar, Narang, Shegal and Sarkani and the survey was held from 7th to 16th Sep 2015.

The survey design was a cross sectional study with two-stages clusters samplings using Standardized Monitoring of Relief and Transition (SMART) methodology.

The Global Acute Malnutrition rates identified by weight-for-height <-2 z-scores (WHO 2006) of **11.8%** (95% CI 9.7-14.3) were found to be serious while GAM was alert if MUAC <-125 rates are considered (**8.7%**, (95% CI 7.1-10.5)). These two rates do not cover the same individuals in the sample. The rates of stunting and underweight were extremely high, 50.3 % (95% CI 57.3-65.6) and **37.7%** (95% CI 33.5-42.1). The mortality rates were acceptable: 0, 30 (95 % CI 0.17-0.52) of CDR and 1.66 (**95%** CI 0.97-2.82) for U5MR.

The geographical terrain of the Kuner province are mountains and has made it mostly inaccessible to basic health services including nutrition services for the male and female children and women especially in the Wata poor, Asmar and Shegals districts which were included in the Assessments, in the summer all of peoples are going to mountains and grasses place to collect the grasses and woods and this times poor care taking of children happened.

The analysis of possible contributing factors has shown compromised mother's nutritional status are very high (18.4%), low Iron supplementation within pregnant (37.1%), 2-weeks recall morbidity (25%), low vitamin A supplementation (64 % and very low de-worming for children (45 %), as well as extremely poor exclusive breastfeeding (46%) and timely complementary feeding practices (73%).

In conclusion, this survey provided evidence that the children in Kuner province were under acute and chronic nutritional stress in form of stunting indicating the requirement of urgent appropriate public health nutritional intervention. The findings of this survey have important implications for public health policy-makers, planners and organizations seeking to meet national and international developmental targets.

The recommendations are made mainly to address the risk factors to under nutrition, especially all services of preventive health such as supplementation for children and pregnant women, basic reproductive health. Special attention have to be given to access and utilization of community based health care, at basic health posts and home visits, to reinforce basic IYCF, with strong focus to exclusive breastfeeding and complementary feeding promotion and support. Coordinated multi-sectorial long-term programming at provincial level would be best to support the worrying very high levels of acute malnutrition and stunting.

INTRODUCTION:

Kunar is one of the 34 provinces of Afghanistan, located in the northeastern part of the country. It has 15 districts: Bar Kuner, Chapa Dara, Dan gam, Dara I Pech, Ghazi Abad, Khas Kuner, Naran Aw Badil, Marwera, Nari, Nor gal, Sawkai, Shaegal, Sarkani, Wata poor and capital is Asadabad.

It is one of the four "N2KL" provinces (Nangarhar Province, Nuristan Province, Kuner Province and Laghman Province).N2KL is the designation used by US and Coalition Forces in Afghanistan for the rugged and very violent region along the Line border opposite Pakistan's Federally Administered Tribal Areas and Khyber Pakhtunkhwa. Kuner is the center of the N2KL (Nangarhar, Nuristan, Kuner, Laghman) region.

It borders with Nangarhar Province to the south, Nuristan Province to the north, Laghman Province to the west and has a border with Pakistan in the east. The province covers an area of 4339 km². Nearly nine tenths (86%) of the province is mountainous or semi mountainous terrain while one eighth (12%) of the area is made up of relatively flat land. The primary geographic features of the province are the lower Hindu Kush mountains which are cut by the Kuner River to form the Kuner. The River flows south and southwest from its source in the Pamir area and is part of the Indus river watershed via the Kabul River which it meets at Jalalabad. The Kuner is a primary draining conduit for the Hindu Kush basin and several tributaries, including the Pech, form distinct and significant valleys in the area. The mountains, narrow valleys with steep walls, and rivers present formidable natural obstacles and have impacted all movement through the province throughout history. Even in the early 21st century, movement on foot, with pack animals, or with motorized vehicles is extremely limited and challenging due to the significant geographic restrictions.

According to latest statistics, the total population of Kuner province was estimated to be around **428,800**.¹ Pashtuns are majority and make up to 95% of the total population, followed by Nuristanis at 5%. Pashto is the main language in the area and nearly all the residents practice Sunni Islam.

Around 96% of the population of Kuner lives in rural districts while 4% lives in urban areas. Momandzai, Safi, Salarzai, and Mishwanai are among the most important tribes.

Only 5 out of 15 districts in Kuner province was surveyed due to security issues and inaccessibility of far areas (see table 1 below) The population of these 3 district represent 41% of the entire population of Kuner Province(**428,800**). According to SMART methodology, the results cannot be extrapolated to the whole province but only representative of the surveyed areas. This is a limitation with regards to having a complete picture of the nutritional status of children under five year and pregnant/lactating women in the Kuner province.

Table 1: Districts covered in SMART survey, Kunar Province, September 2015.

District	Total Population (inhabitants)
Wata poor	52228
Narang	38476
Asmar	25116
Shigal	60456

¹Settled population of Kunar province civil Division Urban, Rural and Sex 2012-2013

Sarkani	33781
Total	177013

Objective of the survey

Broad objective

- To evaluate nutrition situation of vulnerable population groups in 5 districts of Kuner together with estimation the level of possible contributing factors.

Specific objective

- To estimate Crude death Rate and under five death rate
- To determine prevalence of under nutrition in 0-59 months children
- To determine core IYCF practices of children 0-23 months
- To determine the MUAC based nutrition status of Pregnant and lactating women
- To study WASH proxy indicators: household water storage, water use and mother's hand washing practices.
- To estimate Vitamin A supplementation and deworming coverage in the last 6 months among children under 5 years and Iron/folate supplementation among pregnant women.
- To estimate coverage of measles and BCG vaccination
- To assess the 2-weeks recall morbidity among children 0-59 months based

Justification of the survey

The justification of this SMART survey was to investigate and find up to date nutrition, mortality and IYCF data specific to these districts and to inform better future programming with evidence based specific information for the areas of intervention of Première Urgence-Aide Médicale Internationale (PU-AMI).

PU-AMI is BPHS implementing partner of MoPH in Kuner. As such PU-AMI is charged to mainstream CMAM in health facilities under their responsibility. The present survey will help them to improve their programming and it is viewed as a great opportunity to build PU-AMI staffs capacity on the ground.

Since there is no district specific information on nutritional status of local population, this survey was provide information relevant only for the 5 covered districts. This information was also complementing the results from 2013 National Nutrition Survey providing an update for those 5 districts.

Sample size for the anthropometry and the mortality survey

The sample size of households to survey was determined by using the ENA for SMART 2011 software (April 2015). The table below summarizes all parameters used for sample size calculation.

Table 2: Parameters for sample size calculation for anthropometry, SMART-KUNAR, Sep 2015

Parameters for Anthropometry	Value	Assumptions based on context
Estimated Prevalence of GAM (%)	12 %	According to the MoPH National Nutrition Survey-2013 ² , the Global Acute Malnutrition prevalence is estimated at 16.2% (95% CI 12.32 - 21.08). The standard deviation of these results was considered to be high (SD 2.6) and above the recommended limit of 1.2. But in July 2012 PU-AMI also conducted Nutrition survey before NNS, the prevalence of this survey was 12.0 (95 %CI: 10.1 - 14.3 95%). In this case the point prevalence of 12.0 from the Kuner survey was used because it had standard deviation of 0.94 which is within the limit 1.2. It is therefore considered to be more accurate and thus used as the estimated prevalence
Desired precision	± 3%	Based on the estimated prevalence chosen SMART recommends the following. In case of selection of estimated prevalence lower than 5% a desired precision of 2 is recommended. In case of an estimated prevalence between 5 and 10% the recommended desired precision is ±2.5 and a precision of ±3 for estimated prevalence of 10-15%. Since the estimated prevalence for this survey is 12% then a desired precision of 3 was selected as per SMART recommendation.
Design Effect	1.5	The population living in the 5 targeted districts is considered as having similar living conditions and the same access to food and social conditions. Nevertheless, access to health facilities cannot be estimated as similar within the targeted population as some remote areas are not well served by health facilities. Hence the design effect was estimated at 1.5.
Children to be included	736	Minimum Children 6-59 months old. However to avoid possible bias of selection for younger age group, all children from 0 to 59 months old found in the selected households were surveyed.
Average HH Size	7.5	According to CSO population data 2010-2011, the average household size is 5.5. According to the National Nutrition Survey 2013, the average household size is 7.7 – most recent result. According to the National Mortality Survey of 2010, the average household size is 7, 8. According to the national vulnerability assessment of Afghanistan 2014, the average HH size is 7.3 ³ . Therefore, based on these 4 sources, an average household size of 7.5 is used based on 2 more recent results.
% Children under-5	15.6%	The proportion of children under five was estimated at 20% according to the national nutrition policy and CSO estimates ⁴ . However, the estimated U5 population according to the Afghanistan Mortality survey 2010 is at 15.6% providing a more conservative and accurate percentage ⁵ . Therefore, 15.6% is used and considered the more conservative and accurate estimate.

² National Nutrition Survey of Afghanistan, UNICEF, 2013

³ National vulnerability assessment of Afghanistan, 2014

⁴ CSO: Central Statistics Office of Afghanistan, 2010-2011

⁵ Afghanistan Mortality survey, 2010

% Non-response Households	6%	The percentage of non-respondent households was estimated at 6%.
Households included	744	Households
Parameter	Mortality survey	Rationale
Estimated death rate	0.5/10000 /day	No updated death rate at population level; Recommended in cases where there is no specific mortality data for the area to be surveyed
Desired precision	0.3	In order to meet set mortality objectives and inline to estimated death rate
Design effect	1.5	Cater for heterogeneity in the County population being sampled is homogeneous
Recall period	120	Start point of recall period (during the start 8 th of Hama solar month 1394.
Average HH size	7.5	National vulnerability assessment of Afghanistan -2014 and National Nutrition Survey 2013
Per cent of non-respondent	6%	Past experience from assessments in Afghanistan due to cultural challenges and sensitivity regarding mortality information. Anticipated community mobilization is expected to create further awareness
Population to be included	2904	Population
Households to be Included	412	Households

1. IYCF Sampling

The sample size for collection of data on IYCF indicators were calculated by developing a stratified proportionate sampling methodology (using the Care International Sampling Spread Document) so as to cater for the sample sizes required for the various indicators of IYCF practices, which are disaggregated by age. Four main IYCF indicators (WHO, 2010)⁶ were used to calculate the sample size. The prospected prevalence rates of the four indicators: Exclusive Breastfeeding Rate; Timely Initiation of Breastfeeding; Minimum Dietary Diversity and Minimum Meal Frequency (Table 3) were used to determine the sample size. The same desired precision levels were used for the each of the four IYCF indicators and a design effect of 1.5 was used for the cluster methodology (Table 2). Information on the proportion of the under-fives and the average household size was solicited from the Afghanistan mortality survey 2010.

⁶ WHO 2010, Indicators for Assessing Infant and Young Child Feeding Practices

A non-response rate estimated at 6% (based on rationale provided above) was used in the calculation of the sample. The resulting sample sizes for the four IYCF indicators are shown in the Table 2 below

In the table below in order to estimate the actual population for children 0-23 months the IYCF calculator has factored the percentage of children in this group by assuming that 40% of children under the age of 5 years were between 0-23 months. In this case the calculation were

$$\begin{aligned}
 & \text{Total \# of HH} \\
 & = \left(\frac{\text{sample size of children}}{\frac{\text{average HH size} \times \% \text{ under 5 years}}{100}} \right) \times 0.4 \\
 & + \left(\frac{\text{sample size of children}}{\frac{\text{average HH size} \times \% \text{ under 5 years}}{100}} \right) \times 0.4 \Big) \times \% \text{ non response rate}
 \end{aligned}$$

Table 3: IYCF sample size calculation

Indicator	Estimated prevalence (%)	± desired precision	Design effect	Sample size (children 0-23 m)	Households to be included
Exclusive breastfeeding	50	8	2	327	330
Timely initiation of breastfeeding	50	8	2	327	330
Minimum dietary diversity	50	8	2	327	330
Minimum meal frequency	50	8	2	327	330

For the exclusive breast feeding indicator, the survey was conducted the questionnaires to all illegible children found in the survey.

Based on the parameters indicated above, Anthropometric sample were used as the overall sample size since it is the highest and therefore qualifies to represent the other indicators. Therefore with the selection of the highest sample size (744 HH) the other indicators were representation within the larger sample size selected.

2. Sampling Methodology

A two-stage cluster sampling with probability proportionate to size (PPS) design were employed for the integrated nutritional assessments. The Emergency Nutrition Assessment (ENA) for Standardized Monitoring of Relief and Transitions (SMART) latest version (updated 21st April 2015) were used to determine the sample size using.

5.1 Selecting clusters

A two stage sampling methodology was employed. In the first stage is the cluster selection. Clusters were sampled using probability proportional to population size (PPS).

It is estimated that one team could cover 16 households per day. By targeting 16 households per cluster per day, a total number of 47 clusters are expected to be reached over the duration of this survey (744 HHs/16HHs/day=46.5 clusters), which were round up to 47 clusters in order to reach the required 744 households. This was allowed the survey to reach the minimum sample required of 736 children for the anthropometric sample – Children 6-59 months.

A total of 47 villages corresponding to 47 clusters were included in the survey; Reserve Clusters (RCs) were selected by ENA software version 2011 updated 21st April 2015. Reserve clusters was only been used if 10% or more clusters were impossible to reach during the survey.

5.2 Selecting households and children

Simple random sampling method were used where an up-to-date list of the households in each village were created to select the households at random, with enough information to allow them to be located. All households were enumerated and given numbers by the survey team. The 16 households were chosen randomly from these enumerated households, by randomly drawing from a hat or using a random number table. In each selected village, one or more community member(s) were asked to help the survey teams to conduct their work by providing information about the village with regard to the geographical organization or the number of households.

In cases where it is difficult to obtain an updated list of Households systematic random sampling were used to identify the households to be surveyed. The teams were trained on both methods of sampling (simple and systematic random sampling) and they was also be offered with materials to assist in determining the households during the data collection exercise.

In cases where there are large villages in a cluster, the village was divided into smaller segments and a segment was selected randomly to represent the cluster. This division was done based on existing administrative units e.g. neighborhoods, or streets or natural landmarks like river, road, or public places like market, schools, and masjids.

All the children living in the selected house in the correct age range (children from 0 to 59 months old were included for anthropometric measurement and 0-23 months for IYCF were included, without regard to height). If more than one eligible child is found in a household, both were included, even if there are twins. Eligible orphans living in the selected Households was also be surveyed.

All of the selected HH were included in the mortality survey as well as was respondent to questions concerning the HH as a whole (ex. water storage).

Any empty households, or households with missing or absent children were revisited at the end of the sampling day in each cluster; any missing or absent children that was not be subsequently

found was not be included in the survey. A cluster control form was used to record all these missed and absent households.

3. Case definitions and inclusion criteria

The household were the basic sampling unit. Here, a household were defined as all people eating from the same pot and living together (WFP definition). In Afghanistan, the term household is often defined and/or used synonymous with a compound – which potentially represents more than one household as defined here. In this case, a two-step process were ensured with the village leaders/community elders and then identifying compound together with the use of the list of households within the community, asking if there are multiple cooking areas to determine what members of the household/compound should be included in the study.

Different parameters are used to assess the nutritional status of an individual. Weight, height, Mid Upper Arm Circumference and bilateral oedema are the most commonly used. These are often linked to sex and age.

For each selected child, the following information were collected:

✓ Age (in months)

Only children between 0 and 59 months old of age were included. Height was not be considered as a valid criterion in absence of age due to the high stunting rates in KUNAR province. Age was confirmed by showing a vaccination card or a birth certificate, if available. If these documents are not available, the use of a local event calendar built for Kuner province was used to determine the age. The age was recorded into the questionnaire in months.

✓ Sex

Male or female

✓ Weight (in kg)

Children were weighed to the nearest 0.1kg by using an Electronic Uni-scale. The children who can easily stand were asked to stand on the weighing scale and their weight recorded. In a situation when the children could not stand up, the double weighing method were applied.

✓ Height (in cm)

Measuring board was used to measure bare headed and barefoot children. The precision of the measurement is 1 mm. Children of less than 2 years of age were measured lying down and those equal to or above 2 years of age measured standing up.

✓ Mid-Upper Arm Circumference (in mm)

MUAC were used as an indicator of mortality risk for malnutrition and were measured to the nearest 1mm for all children with an indicated age of greater than 6 months, using the UNICEF MUAC strips. An adult MUAC tape were used to measure women of reproductive age (15-49 years)

✓ Oedema

Only children with bilateral pitting nutrition oedema were recorded as having nutritional oedema

this was checked by applying normal thumb pressure for at least 3 seconds to both feet.

4. Anthropometric Indicators: Definition of nutritional status of children 0-59 months

7.1 Acute malnutrition

Acute malnutrition in children 0-59 months can be expressed by using 2 indicators; Weight for Height (W/H) or Mid Upper Arm Circumference (MUAC) as described below.

✓ **Weight-for-height index (W/H)**

A child's nutritional status is estimated by comparing it to the weight-for-height curves of a reference population (WHO standards data⁷). These curves have a normal shape and are characterized by the median weight (value separating the population into two groups of the same size) and its standard deviation (SD).

The expression of the weight-for-height index as a Z-score (WHZ) compares the observed weight (OW) of the surveyed child to the mean weight (MW) of the reference population, for a child of the same height. The Z-score represents the number of standard deviations (SD) separating the observed weight from the mean weight of the reference population: $WHZ = (OW - MW) / SD$.

During the field data collection, the weight-for-height index in Z-score was calculated on the field for each child in order to refer malnourished cases to appropriate centre if needed. Moreover, the results were presented in Z-score using WHO reference in the final report.

✓ **Mid Upper Arm Circumference (MUAC)**

The mid upper arm circumference does not need to be related to any other anthropometric measurement. It is a reliable indicator of the muscular status of the child and is mainly used to identify children with a risk of mortality. The MUAC is an indicator of malnutrition only for children greater or equal to 6 months.

Table 4: Cut offs points of MUAC, children 6-59 months, WHO Recommendations

Target group	MUAC (mm)	Nutritional status
Children 6-59 months	> or = 125 and < 135	No malnutrition
	< 125 and > or = 115	Moderate acute malnutrition
	< 115	Severe acute malnutrition

✓ **Nutritional bilateral pitting oedema**

Nutritional bilateral pitting oedema is a sign of Kwashiorkor, one of the major clinical forms of severe acute malnutrition. When associated with Marasmus (severe wasting), it is called Marasmic-Kwashiorkor. Children with bilateral oedema are automatically categorized as being severely malnourished, regardless of their weight-for-height index. The table below defines the acute malnutrition according to W/H index, MUAC criterion and oedema.

⁷ WHO: World Health Organization, WHO growth curves for children, 2006

Table 5: Definition of acute malnutrition according to weight-for-height index (W/H), expressed as a Z-score according to WHO standards

Severe Acute Malnutrition (SAM)
W/H <-3 z-score and /or bilateral oedema and/or MUAC < 115 mm
Moderate Acute Malnutrition
W/H <-2 z-score and >= -3 z-score and absence of bilateral oedema and/or MUAC >= 115mm and <125mm
Global Acute Malnutrition (GAM)
W/H <-2 z-score and /or bilateral oedema and MUAC < 125 mm

7.2 Chronic malnutrition

The height-for-age index (H/A)

The height-for-age measure indicates if a child of a given age is stunted and so if he is chronically malnourished. This index reflects the nutritional history of a child rather than his/her current nutritional status. This is mainly used to identify chronic malnutrition. The same principle is used as for weight-for-height; except that a child’s chronic nutritional status is estimated by comparing its height with WHO standards height-for-age curves, as opposed to weight-for-height curves. The height-for-age index of a child from the studied population is expressed in Z-score (HAZ). The HAZ cut-off points are presented in table 6.

Table 6: Cut offs points of the Height for Age index (HAZ) expressed in Z-score, WHO standards

Not stunted	≥ -2 z-score
Moderate stunting	-3 z-score ≤ H/A < -2 z-score
Severe stunting	< -3 z-score

7.3 Mortality Indicator Calculation

The mortality indicators included all households, regardless of the presence of children. All members of the household were counted, using the household definition.

✓ Crude death rate (CDR)

Number of persons in the total population that dies over a defined period of time.

$$CDR = \frac{\text{Nb of deaths x 10000 persons}}{\text{population at mid – interval x time interval in days}}$$

✓ Under-5 death rate (U5DR)

The probability for those children aged 0-5 years to die during a specific time interval. Calculated as:

$$U5DR = \frac{\text{Nb of deaths of U5s} \times 10000 \text{ U5s}}{\text{population of U5s at mid - interval} \times \text{time interval in days}}$$

5. Additional Indicators – Health & WASH

Beside anthropometric data, additional information was collected as follows:

✓ Immunization status, deworming and vitamin A supplementation

Mothers/caretakers of all children were asked if children received all the necessary vaccinations, which was subsequently be verified by reviewing the vaccination card, if available. If the vaccination card was not available, then recall of the caregiver option was considered. The deworming and the Vitamin A supplementation of children were also recorded using samples.

✓ Morbidity

Mothers/caretakers of children were asked if children had experienced an illness in the past 2 weeks. Acute respiratory infection, fever and diarrhoea were recorded when symptoms according to the case definition are described by the caretaker.

✓ Mothers nutritional status and Iron/Folate supplementation for pregnant

Women in childbearing age were assessed for their nutritional status based on MUAC using the cut-off of 230 mm.

✓ Water storage and Usage

House hold heads were asked what type of container they use for storing drinking water and also how much water they used in the HH in the last 24 hours to assess the water use per person per day.

✓ Hand washing practices

The mothers were asked on what occasions they wash their hands and also what they use to wash their hands to determine the hand washing practices in the surveyed area.

6. Infant and Young Child Feeding Practices Indicators (IYCF)

The IYCF indicators used in the measurement of infant and young child feeding practices asked to the mothers/caretakers of children aged 0-23 months are described as follows.

✓ Child ever breastfed

Proportion of children who have ever received breast milk.

✓ Timely initiation of breastfeeding

Proportion of children born in the last 23 months who were put to the breast within one hour of birth.

✓ Provision of colostrum in the first 3 days of life

Proportion of children who received colostrum (yellowish liquid) within the first 3 days after birth.

✓ Exclusive breastfeeding under 6 months

Proportion of infants 0-5 months of age who are fed exclusively with breast milk.

✓ Continued breastfeeding at 1 year

Proportion of children 12 – 15 months of age who are fed with breast milk.

✓ **Individual Dietary Diversity Score**

Proportion of 6-23 months children consumed minimum 4 food groups the last 24 hours.

✓ **Introduction of solid, semi-solid or soft foods:**

Proportion of infants 6-8 months of age who receive solid, semi-solid or soft foods.

✓ **Continued breastfeeding at 2 years**

Proportion of children 20–23 months of age who are fed breast milk.

7. Questionnaires, training, team compositions and supervision

Five teams of three members were conducted the field data collection. Each team was composed of one PU-AMI team leader and two PU-AMI data collector. Each team had at least two female data collectors to ensure acceptance of the team amongst the surveyed households; particularly for IYCF questionnaires. Each female member of the survey team was accompanied with a mahram⁸ to facilitate the work of the female data collectors at the community level. The teams were supervised by ACF and PU-AMI nutrition program manager/nutrition focal points.

The entire teams were received a 7-days training on the survey methodology and all its practical aspects; conducted by ACF Nutrition SMART Program Manager. A standardization test was conducted over the course of 1day, measuring 10 children, in order to evaluate the accuracy and the precision of the team members in taking the anthropometrics measurements. A one-day field test was conducted by the teams in order to evaluate their work in real field conditions. Feedback was provided to the team in regard to the results of the field test; particularly in relation to digit preferences and data collection. Refresher training on the anthropometric measurement and on the filling of the questionnaires and the household's selection were organized on the last day of the training by ACF to ensure overall comprehension before going to the field.

One field guidelines document with instructions and household definition and selection document were provided to each team member. All documents, such as local event calendar, questionnaires or consent forms were translated in Pashtu, local language, for better understanding and to avoiding direct translation during the data field collection. The questionnaires were back translated using a different translator and were pre-tested during the field test. Alterations were made as necessary.

Daily data entry and analysis were done using ENA for anthropometric data, plausibility check, and feedback were provided to the data collection teams. Anthropometric data was all be directly entered into ENA while IYCF and other data were completed through an excel spreadsheet.

⁸ Women are not allowed to go outside without being accompanied by one male relative called locally a 'mahram'.

8. Data analysis

The anthropometric and mortality data were analyzed using ENA software 2011 version, 21st April 2015 updated. Survey results were presented in reference to WHO standards for overall final analysis.

Other indicators were analyzed using Excel version 2010 and were expressed in percentage out of the sample surveyed.

SURVEY FINDING:

3.1. Child health Nutrition

3.1.1. Description of the sample

Anthropometric data was collected from 1184 children between 6-59 months. Out of 47 clusters were selected in the sample and clusters remained due to security problems and data collection were done from 46 clusters and after this Non-response Rate was 0.7 %, the overall boy to girl ratio was 1.1 indicating that sampling was unbiased and within expected range of values (0.8 – 1.2) (Table 7).

The age distribution showed under representation in some age groups such as 42-59 months. This could probably be due to approximation of ages amongst 81% of the sampled children. The sex and age pyramid (Figure 2) follow a normal shape.

Table 7: Distribution of age and sex of sample, SMART Kuner, Sep 2015

AGE (mo)	Boys		Girls		Total		Ratio
	no.	%	no.	%	no.	%	Boy:girl
6-17	152	49.4	156	50.6	308	26.0	1.0
18-29	162	51.9	150	48.1	312	26.4	1.1
30-41	137	51.9	127	48.1	264	22.3	1.1
42-53	101	52.3	92	47.7	193	16.3	1.1
54-59	62	57.9	45	42.1	107	9.0	1.4
Total	614	51.9	570	48.1	1184	100.0	1.1

Figure 1: Population age and sex pyramid, SMART Kuner, Sep 2015

3.2. Anthropometric results

3.2.1. Data quality

The anthropometric data were analyzed using ENA for SMART Software (version 2011, 21st April 2015 updated). The plausibility check report is available in Annex 2.

A summary of the statistical parameters by index is in the table below.

Table 8: Mean z-scores, Design Effects and excluded subjects, SMART- Kuner, Sep 2015

Indicator	n	Mean z-scores ± SD	Design Effect (z- score < -2)	z-scores not available*	z-scores out of range
Weight-for-Height	1167	-0.89±0.94	1.46	0	17
Weight-for-Age	1167	-1.72±1.04	2.32	0	17
Height-for-Age	1123	-1.98±1.21	1.69	0	61

* contains for WHZ and WAZ the children with edema.

3.3. Prevalence of acute malnutrition

Weight-for-height Z-scores (WHO 2006) and/or oedema

The sex and age disaggregated results are presented in Table 9 and 10 respectively. The Prevalence of wasting is insignificantly higher among boys as compared to girls. The younger Children (6-29 months) seem to be more affected than older (30-59 months). There were no edematous cases (Table 9).

Table 9: Prevalence of acute malnutrition based on weight-for-height z-scores (and/or oedema) and by sex, SMART- Kuner, Sep 2015

	All n = 1167	Boys n = 603	Girls n = 564
Prevalence of global malnutrition (<-2 z-score and/or oedema)	(138) 11.8 % (9.7 - 14.3 95% C.I.)	(83) 13.8 % (10.9 - 17.3 95% C.I.)	(55) 9.8 % (7.2 - 13.1 95% C.I.)
Prevalence of moderate malnutrition (<-2 z-score and >=-3 z-score, no oedema)	(111) 9.5 % (7.7 - 11.7 95% C.I.)	(67) 11.1 % (8.5 - 14.3 95% C.I.)	(44) 7.8 % (5.6 - 10.8 95% C.I.)
Prevalence of severe malnutrition (<-3 z-score and/or oedema)	(27) 2.3 % (1.5 - 3.5 95% C.I.)	(16) 2.7 % (1.6 - 4.3 95% C.I.)	(11) 2.0 % (1.0 - 3.7 95% C.I.)

The prevalence of oedema is 0.0%.

Table 10: Prevalence of acute malnutrition by age, based on weight-for-height z-scores and/or oedema, SMART-Kuner, Sep 2015

Age (mo)	Total no.	Severe wasting (<-3 z-score)		Moderate wasting (>= -3 and <-2 z-score)		Normal (>= -2 z score)		Oedema	
		No.	%	No.	%	No.	%	No.	%
6-17	299	14	4.7	38	12.7	247	82.6	0	0.0
18-29	308	8	2.6	36	11.7	264	85.7	0	0.0
30-41	262	3	1.1	18	6.9	241	92.0	0	0.0
42-53	192	1	0.5	16	8.3	175	91.1	0	0.0
54-59	106	1	0.9	3	2.8	102	96.2	0	0.0
Total	1167	27	2.3	111	9.5	1029	88.2	0	0.0

Table 11: Distribution of acute malnutrition and oedema based on weight-for-height z-scores, SMART-Kuner, Sep 2015

	<-3 z-score	>=-3 z-score
Oedema present	Marasmic kwashiorkor No. 0 (0.0 %)	Kwashiorkor No. 0 (0.0 %)
Oedema absent	Marasmic No. 35 (3.0 %)	Not severely malnourished No. 1149 (97.0 %)

Figure 2: Distribution Curve for Weight – for – height Z score, SMART-Kuner, Sep 2015

MUAC cut-off classification and/or oedema:

The prevalence of acute malnutrition based on MUAC cut-off is presented in **Table 12**. The younger children (6-29 months) seem to be more affected than older (30-59 months); Out of 143 children identified with MUAC<125 mm, only 61 were with WHZ<-2 representing only 35.4% of the acutely malnourished children in the sample.

Table 12: Prevalence of acute malnutrition based on MUAC cut off's (and/or oedema) and by sex, SMART-Kuner, Sep 2015

	All n = 1178	Boys n = 612	Girls n = 566
Prevalence of global malnutrition (< 125 mm and/or oedema)	(102) 8.7 % (7.1 - 10.5 95% C.I.)	(47) 7.7 % (6.0 - 9.8 95% C.I.)	(55) 9.7 % (7.4 - 12.7 95% C.I.)
Prevalence of moderate malnutrition (< 125 mm and >= 115 mm, no oedema)	(75) 6.4 % (5.1 - 8.0 95% C.I.)	(33) 5.4 % (4.0 - 7.2 95% C.I.)	(42) 7.4 % (5.4 - 10.2 95% C.I.)
Prevalence of severe malnutrition (< 115 mm and/or oedema)	(27) 2.3 % (1.5 - 3.5 95% C.I.)	(14) 2.3 % (1.3 - 4.1 95% C.I.)	(13) 2.3 % (1.3 - 3.9 95% C.I.)

Table 13: Prevalence of acute malnutrition by age, based on MUAC cut off's and/or oedema, Sep 2015.

Age (mo)	Total no.	Severe wasting (< 115 mm)		Moderate wasting (>= 115 mm and < 125 mm)		Normal (>= 125 mm)		Oedema	
		No.	%	No.	%	No.	%	No.	%

6-17	304	20	6.6	34	11.2	250	82.2	0	0.0
18-29	311	4	1.3	34	10.9	273	87.8	0	0.0
30-41	264	3	1.1	3	1.1	258	97.7	0	0.0
42-53	192	0	0.0	3	1.6	189	98.4	0	0.0
54-59	107	0	0.0	1	0.9	106	99.1	0	0.0
Total	1178	27	2.3	75	6.4	1076	91.3	0	0.0

5.5. Prevalence of Underweight based (WHO 2006)

The underweight is defined by weight-for-age z-scores (WAZ). The sex and age disaggregated results are represented in **Table 14 and 15**.

Table 14: Prevalence of underweight based on weight-for-age z-scores by sex, SMART-Kuner, Sep 2015.

	All n = 1167	Boys n = 604	Girls n = 563
Prevalence of underweight (<-2 z-score)	(440) 37.7 % (33.5 - 42.1 95% C.I.)	(228) 37.7 % (31.5 - 44.4 95% C.I.)	(212) 37.7 % (33.0 - 42.5 95% C.I.)
Prevalence of moderate underweight (<-2 z-score and >=-3 z-score)	(309) 26.5 % (23.3 - 29.9 95% C.I.)	(162) 26.8 % (21.5 - 32.9 95% C.I.)	(147) 26.1 % (22.5 - 30.0 95% C.I.)
Prevalence of severe underweight (<-3 z-score)	(131) 11.2 % (9.1 - 13.7 95% C.I.)	(66) 10.9 % (8.6 - 13.8 95% C.I.)	(65) 11.5 % (8.7 - 15.2 95% C.I.)

Table 15: Prevalence of underweight by age, based on weight-for-age z-scores, SMART-Kuner, Sep 2015.

Age (mo)	Total no.	Severe underweight (<-3 z-score)		Moderate underweight (>= -3 and <-2 z-score)		Normal (> = -2 z score)		Oedema	
		No.	%	No.	%	No.	%	No.	%
6-17	299	30	10.0	69	23.1	200	66.9	0	0.0
18-29	306	46	15.0	99	32.4	161	52.6	0	0.0
30-41	263	32	12.2	76	28.9	155	58.9	0	0.0
42-53	193	18	9.3	40	20.7	135	69.9	0	0.0
54-59	106	5	4.7	25	23.6	76	71.7	0	0.0
Total	1167	131	11.2	309	26.5	727	62.3	0	0.0

5.6. Prevalence of Stunting based on Height-for-Age Z scores (HAZ)

The chronic malnutrition or stunting is defined by Height-for-age Z-scores (HAZ) <-2. The sex and age disaggregated results are represented in **Table 16 and 17**.

Table 16: Prevalence of stunting based on height-for-age z-scores and by sex, SMART-Nuristan, Aug 2015.

	All n = 1123	Boys n = 578	Girls n = 545
Prevalence of stunting (<-2 z-score)	(565) 50.3 % (46.4 - 54.2 95% C.I.)	(295) 51.0 % (45.9 - 56.1 95% C.I.)	(270) 49.5 % (44.3 - 54.8 95% C.I.)
Prevalence of moderate stunting (<-2 z-score and >=-3 z-score)	(332) 29.6 % (26.5 - 32.8 95% C.I.)	(170) 29.4 % (25.4 - 33.8 95% C.I.)	(162) 29.7 % (25.3 - 34.5 95% C.I.)
Prevalence of severe stunting (<-3 z-score)	(233) 20.7 % (17.8 - 24.1 95% C.I.)	(125) 21.6 % (18.3 - 25.4 95% C.I.)	(108) 19.8 % (15.8 - 24.6 95% C.I.)

Table 17: Prevalence of stunting by age based on height-for-age z-scores, SMART-Kuner, Sep 2015.

Age (mo)	Total no.	Severe stunting (<-3 z-score)		Moderate stunting (>= -3 and <-2 z-score)		Normal (>= -2 z score)	
		No.	%	No.	%	No.	%
6-17	280	32	11.4	73	26.1	175	62.5
18-29	297	86	29.0	105	35.4	106	35.7
30-41	255	66	25.9	74	29.0	115	45.1
42-53	187	35	18.7	50	26.7	102	54.5
54-59	104	14	13.5	30	28.8	60	57.7
Total	1123	233	20.7	332	29.6	558	49.7

Figure 3 shows the distribution of HAZ of the observed population, compared to WHO Reference curve. In Kuner, it was shifted to the left, suggesting restricted linear growth of the observed population. Further analysis (**Figure 4**) suggests that linear growth retardation is at its highest in the lower age group of children (18-29 months) and overall trend increases with the increase of age.

Figure 3: Gaussian (normal) distribution curve, HAZ, SMART –Kuner, Sep 2015

Figure 4: Trends of stunting over the age distribution, SMART-Kuner, Sep 2015

4.7. Prevalence of overweight based (WHO 2006):

The prevalence of overweight is based on weight-for-height in z-score >2 and found to remain low.

Table 18: Prevalence of overweight based on weight for height cut offs and by sex (no oedema), SMART-Kuner, Sep 2015.

	All n = 1167	Boys n = 603	Girls n = 564
Prevalence of overweight (WHZ > 2)	(1) 0.1 % (0.0 - 0.6 95% C.I.)	(1) 0.2 % (0.0 - 1.2 95% C.I.)	(0) 0.0 % (0.0 - 0.0 95% C.I.)
Prevalence of severe overweight (WHZ > 3)	(0) 0.0 % (0.0 - 0.0 95% C.I.)	(0) 0.0 % (0.0 - 0.0 95% C.I.)	(0) 0.0 % (0.0 - 0.0 95% C.I.)

* contains for WHZ and WAZ the children with edema

6. CHILD HEALTH INDICATORS

6.1. Two weeks recall morbidity (children 0-59 months)

A total of 1331 respondents answered about whether they experienced health issue in the last 2 weeks prior to the day of visit of the survey team, **25 %** responded with “yes”. The frequencies of the symptoms are presented in the figure below.

Figure 5: Morbidity data, SMART –Kuner, Sep 2015

6.2. Immunization

Immunization, supplementation and deworming are proxy indicators informing community health outreach and health seeking behaviours concisely information (**table 19** for all vaccination).

Table 19: Immunization age based on vaccination, SMART –Nuristan, Aug 2015

Types of Vaccine	Yes by card/ by /No/DNK	Yes Recall	%
Measles immunization coverage (>=9 months old(n=1081))	Verification cards	by	52
	Both by cards and recalls		94
BCG immunization coverage (0-59 months old (n=1331))	Scar		94
	No Scar		6
Polio immunization coverage (0-59 months old children(n=1331))	Verification cards	by	57
	Both by cards and recalls		96

5.3. Supplementation and Deworming

Supplementation and deworming are proxy indicators informing community Health outreach and health seeking behaviors. A summary of the results are presented in the below. See below.

Table 20: Vitamin A and Deworming coverage, SMART –Kuner, Sep 2015

	Class	Frequency	%
Vitamin A supplementation aged 6-59 months (6 months recall) , n=681	Yes	435	64%
	No	246	36%
Deworming aged 12-59 months (6 months recall) , n=1012	Yes	454	45%
	No	558	55%

6. IYCF INDICATORS

Indicators for infant and young child feeding (IYCF) practices included all children 0 – 23 months. A total of 564 children included in the sample. The results are presented as percentage of the total answers available, and as such were not presented with confidence interval (See Table 21).

Table 21: Infant and Young Child Feeding Practice, SMART –Kuner, Sep 2015

Core Indicators	Definition	N	%
-----------------	------------	---	---

Child ever breastfed (n=564)	Proportion of children who have ever received breast milk	564	100
Timely initiation of breastfeeding (n=564)	Proportion of children born in the last 23 months who were put to the breast within one hour of birth	533	95
Provision of colostrum within first 3 days (n=564)	Proportion of children who received colostrum (yellowish liquid) within the first 3 days after birth	563	100
Still breast feeding at 1 year (n=562)	Proportion of children 12–15 months of age who are fed breast milk.	533	95
Exclusive breast feeding (n=564)	Proportion of infants 0–5 months of age who are fed exclusively with breast milk.	346	46
Introduction of solid, semisolid or soft foods (n=78)	Proportion of infants 6–8 months of age who Receive solid, semi-solid or soft foods.	57	73

7. MATERNAL NUTRITION STATUS AND HAND WASHING

All women aged between 15 and 49 years, found in the selected households, were included in the analysis of the following 3 key indicators:

- Physiological status
- Nutritional status based on MUAC cut-off
- Iron/folate for pregnant women (at least once during the visit of the survey team)

The results are presented in the tables below.

Table 22: Physiological status of women of reproductive age (15 – 49 years), (n=1015), SMART – Kuner, Sep 2015

Status	Frequency	%
Pregnant	204	20%
Lactating	509	50%
Pregnant & Lactating	22	2%
Non-pregnant & non-lactating	280	28%

Table 23: Nutritional status of women of reproductive age based on Mid-upper arm, SMART-Kuner, Sep 2015 (n=1012)

MUAC Cutoff	Frequency	%
MUAC <230 mm	186	18.4%
MUAC =or > 229 mm	826	81.6%

Table 24: Iron folate for pregnant women based on available answers, (n=224), SMART –Kuner, Sep 2015

Iron-folate for PLW	Frequency	%
Yes	83	37.1%
No	135	60.3%
Do not know	6	2.7%

Practices of hand washing are indicated in Table 25.

Table 25: Hand washing, SMART –Kuner, Sep 2015, (n=727)

Hand Washing care takers (n=587)	Frequency	%
Only water	164	23%
Soap	235	32%
Soap when I can afford it	326	45%
Traditional herb	2	0%
Other	0	0%

Although the percentage of people using water only for hand washing is low, a chi-square test was done in order to assess the relationship between hand washing and episode of diarrhea. The result indicated that children from households not using soap were more likely to have diarrhea compared to children from households using soap ($p < 0.05$).

Table 26: Hand washing at 4 critical moments, (n=728), SMART –Kuner, Sep 2015

Response	Frequency	%
Wash hands at all 4 critical moments	622	85
After Toilet/latrines	714	98%
Before cooking	684	95%
Before eating	709	98%
After taking children to the toilet	673	93%

* This was a multiple response question; percentages don't add up to 100.

NB: As this information was largely knowledge/recall based, there is no practical Verification process to know if mothers/caretakers actually practiced hand washing at all 4 critical points or if they were largely recalling times to which they were previously informed.

8. MORTALITY AND DEMOGRAPHICS

8.1. Demography

The mortality questionnaire in SMART is designed in a way that some additional useful Demographic data can be withdrawn. Summary is available in **Table 28**. A total of 6957 Individuals were surveyed and 1331 were reported to have children under age of 5 years.

Table 27: Short summary of demographics, SMART- Kuner, Sep 2015

Indicator	Value
Average HH size	9.5
Children under 5	19.8%
Most frequent HH size	7
Min HH Size	2
Max HH Size	35

8.2. Mortality

Mortality was included in the survey, with basic data collected at the household level, using the retrospective mortality methodology, with a 120 days recall period. Heads of household were the main responders, from all households included in the survey, a total of 729 households, regardless if the households had children or not. Crude Mortality Rates and Under Five Mortality rates are presented in Table 27).

Table 288: Crude mortality rates (CMR) and under-5 mortality rates (U5MR), SMART- Kuner, Sep 2015

Retrospective Mortality in 120 days prior to survey	Rate	(95% CI)
CMR (total deaths/10,000 people / day):	0.30	0.17-052
U5MR (deaths in children under five/10,000 children under five / day):	1.61	0.97-2.82

9. HOUSEHOLD INFORMATION

Several questions concerning the surveyed households were collected which included structure and type of households, livelihoods, water access and storage.

9.1. Structure and type of household

This information is concisely presented in the below table:

Table 29: structure and type of households, (n=731) SMART – Kuner, Sep 2015

Head of HH	Frequency	%
Male	714	98%
Female	7	1%
Both	5	1%
Others	5	1%

Table 30: type of family- SMART Kuner, Sep 2015

Family type	Frequency	%
Monogamous	702	96.0%
Polygamous	27	3.7%
Single parent	2	0.3%

9.2. Main lively hoods

The main livelihoods were defined as those of the family heads. The livestock herding was of 1%. See **figure 6** below.

Figure 6: main lively hoods, (n= 731), SMART – Kuner, Sep 2015

10. WAHS

10.2. Water storage and consumption

A total from 731 households studied, representing 729 households during the survey finding showed most of household stored water in closed container/jurricans (98.2 %) water storage in closed container and (1.8 %) water storage in open container (See **figure 7**).

Figure 7: water storages, SMART Kuner, Sep 2015 (n=729)

A total of 731 responders, representing 729 households and 6957 individuals, were included, either male or female. Data collection asked for the total amount of water in total litters you used in your household excluded of animals, and subsequently organized into range of litters

used. The results were then divided into the quantity of water in liters available to each household member per day as compared to SPHERE standard of 15L/person/day. See figure 8 and 9).

Figure 8: Percentage of households with access to 15L of water/person/day (n=729), SMART – Kuner, Sep 2015

Figure 9: Household level daily quantity of water used in liters (n=729), SMART – Kuner, Sep 2015

11. DISCUSSIONS

11.1 Nutritional Status

11.1.1 Global Acute Malnutrition

This SMART Nutrition Survey was conducted in 5 districts of Kuner province between 7th to 16th Sep 2015. The GAM rate, based on WHZ was of 11.8 % [CI: 9.7-14.3]. It is lower than the WHO emergency threshold of 15%, but classified by serious. The SAM rate, based on WHZ, was 2.3% and no emergency, used in the context of Afghanistan to trigger emergency.

The GAM rate based on MUAC was 8.7% [CI: 7.1-10.5], is high from the GAM rate based on WHZ is significant difference. It can be classified as alert if WHO standards are considered. In-depth analysis indicated that the WHZ and MUAC prevalence are not based on the same Children.

Figure10 schematically demonstrates this difference. Only 20.3% children in the sample were detected as acutely malnourished according both criteria. The survey have shown that children having MUAC <125 mm were more stunted (HAZ<-2) than wasted (WHZ<-2). This data support the hypothesis that in Kuner about 35.4 % of the acutely malnourished children are by WHZ. Therefore, MUAC based community screenings are not enough to detect all acutely malnourished children eligible for treatment according to the criteria stipulated in the Afghanistan National IMAM Guidelines. This has to be however further investigated. Both GAM WHZ and MUAC have been more prevalent among children 6-29 months compared to Children 30-59 months old. This suggests higher vulnerability of younger children to wasting.

Figure 10: Overlapping WHZ<-2 and MUAC<125, SMART-Nuristan, Aug 2015

11.1.2. Chronic malnutrition

Chronic malnutrition trends in Kuner province remain worrying. The results of the present survey clearly showed that, based on WHO classification of severity of malnutrition, the overall prevalence of stunting was (50.3%) [CI: 46.4-54.2]. One in every 2 children included in the survey were found to be stunted, while 2 in every 5 children was under weight. The very high stunting rates can probably be due to prevalence of diseases (25% reported of being ill 2 weeks prior to survey), poor infant feeding practices morbidity (exclusive breastfeeding was found to be 46% and timely complementary feeding was of 73%) has been known to expose children morbidity and malnutrition and even death. The rate of stunting was lower than the national stunting figures reported in the NNS2013 (56.3%) and 6% stunting decrease from 2013 NNS , the very young age group, 6-29 months, was found to be suffered by lower linear growth which could be linked with eventual premature or low birth weight babies and/or low maternal nutrition status. Increasing trends of stunting with the age were also observed.

High stunting requires long term nutrition interventions combined with infant and young children nutrition and scaling up deworming practice as well encouraging timely health seeking behavior during illness to be put in place to reverse this trend. Maternal nutrition and reproductive health also needs to be improved significantly in order to have better impact on high stunting.

11.1.3. Maternal nutritional status

There are no commonly accepted standards for maternal nutrition status. In line with the Afghanistan National Guideline, the MUAC cutoff for women of 230 mm is used to approximately identify their status. In this survey 18.4 % of the mothers were found to have a MUAC<230mm, which suggest that a considerable number of PLWs in Kuner are Malnourished. The main concern was iron supplementation among pregnant women which the survey found to be very low (37.1%). The Iron supplementation prevent anemia during pregnancy and eventual life-threatening complications during delivery. Therefore it decreases maternal mortality, prenatal and perinatal infant loss and prematurity which can be directly related to child stunting in the first 2 years of life. Although not of emergency matter, the Iron/Folate supplementation for pregnant women needs to be increased significantly by reinforcing the usual channels for that in BPHS/CBHC. The BPHS Implementing partner needs to make immediately significant progress by reinforcing ANC and CHW home visits to PLW and keep continuously in Kuner province.

11.2. Mortality Rates:

The survey showed that the Crude Mortality Rate (CMR) and under five mortality rate (U5MR) were 0.30 (95% CI: 0.17-0.52) and 1.66 (95% CI; 0.97-2.82) respectively. Both CMR and U5MR rates were below the WHO's emergency thresholds of 2/10,000/day and 4/10,000/day respectively but it is worryingly.

11.2. Risk Factor:

11.2.1. Morbidity, supplementation and deworming

The UNICEF conceptual framework of malnutrition can be used to explain the probable causes of under-nutrition in this area. Diseases weaken an individual immune system causing them have other side effects such as reduced food intake and diarrhea. In the 5 districts of Kuner province, more than half of the sampled children had suffered from one form of illness or another (25 %) such as diarrhea, fever, cough and skin infection.

The coverage of Vitamin A supplementation, 6 months prior to the survey, was good. About 64% children received vitamin A supplementation. One of the core functions of Vitamin A is to boost an individuals' immunity hence important of supplement. Building awareness on Vitamin A is of importance as the current rates are high compared to the recommended WHO target of 80%, vitamin A coverage which probably happened due to effectiveness of the integrated NIDs campaign.

The proportion of all children aged 12-59 months who had received deworming in the last 6 months was poor (45%) in Kuner province it has related in Nutrition for absorption of minerals and vitamins.

11.2.2. Infant and young child feeding practices

Optimal infant and young child nutrition, especially exclusive breastfeeding is estimated to prevent potentially 1.4 million deaths every year among children under five years old. Infant and young child feeding nutrition in this area still needs to be improved.

Findings so far have indicated that timely initiation of breastfeeding, colostrum feeding and continuous breastfeeding up to the first year of life were well practiced by the mothers. However, exclusive breastfeeding rate of 46% respectively is of real concern as these potentially contribute to stunting in the first two years of life. The complementary feeding, is extremely poor (73 %) and often mixed with tea (inhibits iron absorption). These two practices need to be significantly improved in a targeted manner.

11.2.3. Water Hygiene and Sanitation (WASH)

The WASH indicators collected in this survey were mostly limited to the most pragmatic and easy to collect using a SMART methodology. WASH findings from the 5 districts of Kuner province, It is important to note that due to the limited scope of WASH questions and indicators included, a more general conclusion of the WASH situation is not possible. Also the survey did not include observation of the practice of hand washing and the responses are suspected to be more of knowledge,

Morbidity levels are aggravated the poor WAHS condition characterized by poor sanitation facilities and poor hand washing practice at 4 critical points and washing hand practice by soap is very low (32 %) respectively is concern that potentially contribute in the morbidity .

It is very important to know Kuner is difficult geographical terrains and it made mostly inaccessible to health facilities including health and nutrition services.

Traditional barriers those cause inappropriate utilization of health services for instance mother and child services especially in the summer due to collecting woods and grasses in the mountains and immigration from villages to mountains and grasses places

11. RECOMMENDATIONS

Some recommendations have been drawn after the context analysis as a bellow.

Survey finding	Recommendations	Responsible
<p>GAM rates (WHZ base=11.8% and MUAC base=8.7 %) High stunting rate 50.3 %</p>	<ul style="list-style-type: none"> ✓ Prioritize activities addressing chronic malnutrition, high stunting rates, at the community level, through food security/agricultural, nutrition cooking demonstrations, IYCF, micronutrients rich food and appropriate supplementation and improving maternal health and nutrition. ✓ Community mobilization program should be extended to remote areas as much as possible according to security clearance. ✓ To strength and continues TSFP programs to prevent and treat moderate acute malnutrition children. ✓ It is strongly recommended to continue the activities or implementation of IMAM program where do not exist to contribute with the reduction of malnutrition, morbidity and mortality of children. ✓ Increased availability of, and access to, high-quality nutrition-specific services and commodities are essential to address the immediate determinants of malnutrition and ensure optimal child growth and development and women’s nutrition ✓ Support and establish systems for community mobilization and identification and referral of acute malnutrition cases. 	<p>MOPH, Nutrition Cluster BPHS and EPHS implementers</p>
<p>Low Immunization and supplementation</p>	<ul style="list-style-type: none"> ✓ Support ongoing education and quality-improvement programs for pediatricians and other child health care professionals about important vaccine-related issues, including the dissemination of peer-reviewed evidence for more effective immunization delivery ✓ Promote vaccinations involves providing face-to-face services to clients in their homes. Services can include education, assessment of need, referral and provision of vaccinations. Home visiting Interventions can also involve telephone and CWHs follow up systems. 	<p>MOPH , WHO, BPHS and EPHS implementers</p>
<p>Childhoods illness (Child illness =25 %)</p>	<ul style="list-style-type: none"> ✓ Importance of disease control interventions linked to complementary feeding as the two primary immediate causes of child under nutrition. ✓ Improve awareness and investigate more on barriers 	<p>MOPH, Community</p>

	<p>for improved health care seeking by families for management of children’s infections and strength health education.</p>	<p>, BPHS and EPHS implementer</p>
<p>Maternal Nutrition status (MUAC base = 18.4 %) and Iron folate supplementation for PLWs= 37.1%</p>	<ul style="list-style-type: none"> ✓ Community sensitization on importance of micronutrient supplementation. ✓ To increase the Maternal Health Care activities to improve the pregnant and lactating women nutrition status and folate supplementation. ✓ Strengthening of community component and provide FHAG (family Health Action Groups) to improve the maternal nutrition status. ✓ The house hold food security should also be promoted in order to contribute to the nutrition status of the population in need. ✓ Improve women’s nutrition services and counseling during reproductive, antenatal, and postpartum care especially in relation to anemia prevention and treatment, adequate dietary quality and weight gain during pregnancy, maternal nutrition during lactation, and address the special challenges of adolescent pregnancies and pregnancy and lactation. 	<p>MOPH, WFP, BPHS and EPHS implementers</p>
<p>IYCF (exclusive breast feeding = 46 % complementary feeding =73 %)</p>	<ul style="list-style-type: none"> ✓ It is really important to strength and promotes IYCF counselling and food demonstration in health facilities and community level. ✓ To strength and Improved food diversification during weaning and complementary period, increase of meal frequencies that are age-specific 	<p>MOPH, BPHS and EPHS implementers</p>
<p>WASH (hand washing practice at 4 critical point= 85 and mothers soap hand washing practice=32 %)</p>	<ul style="list-style-type: none"> ✓ The component of water and sanitation (WASH) should be taken in to account as a vertical intervention or integrated it to the health promoting programs. ✓ Ensure access to safe drinking water through WASH interventions that are sustainable and easy to maintain to address low water access rates in rural areas ✓ Intervention programmers for improving water, sanitation and hygiene practices including health education to educate the community on domestic treatment of drinking water ✓ Integrate key hygiene actions (safe drinking water, hand-washing with soap, safe disposal of excreta, and food hygiene) as essential components in all targeted nutrition programs. 	<p>MOPH, BPHS and EPHS implementers</p>

Other key programmatic recommendations are:

- Strength regular supervisions, Monitoring and Surveillance systems on health facilities and community level
- To strength active and passive case finding and timely reporting systems
- Advocate at the national level for acceptance of a standardized SMART methodology as Regular monitoring tool for under nutrition levels.
- To survey districts which were not included in this survey. Should be assessed at a later date depending on security access.
- Another survey should be conducted within one year interval in order to assess the existence of changes regarding the nutrition status of the province, moreover some additional indicators like food security should also be consider.

Age ratio of 6-29 months to 30-59 months: 1.10 (The value should be around 0.85).:
 p-value = 0.000 (significant difference)

Statistical evaluation of sex and age ratios (using Chi squared statistic):

Age cat.	mo.	boys	girls	total	ratio boys/girls
6 to 17	12	152/142.5 (1.1)	156/132.3 (1.2)	308/274.7 (1.1)	0.97
18 to 29	12	162/138.9 (1.2)	150/128.9 (1.2)	312/267.8 (1.2)	1.08
30 to 41	12	137/134.6 (1.0)	127/125.0 (1.0)	264/259.6 (1.0)	1.08
42 to 53	12	101/132.5 (0.8)	92/123.0 (0.7)	193/255.5 (0.8)	1.10
54 to 59	6	62/65.5 (0.9)	45/60.8 (0.7)	107/126.4 (0.8)	1.38
6 to 59	54	614/592.0 (1.0)	570/592.0 (1.0)		1.08

The data are expressed as observed number/expected number (ratio of obs/expect)

Overall sex ratio: p-value = 0.201 (boys and girls equally represented)
 Overall age distribution: p-value = 0.000 (significant difference)
 Overall age distribution for boys: p-value = 0.016 (significant difference)
 Overall age distribution for girls: p-value = 0.001 (significant difference)
 Overall sex/age distribution: p-value = 0.000 (significant difference)

Evaluation of Standard deviation, Normal distribution, Skewness and Kurtosis using the 3 exclusion (Flag) procedures

- . no exclusion exclusion from exclusion from
- . reference mean observed mean
- . (WHO flags) (SMART flags)

WHZ

Standard Deviation SD: 1.04 1.01 0.94

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:	12.3%	12.0%
calculated with current SD:	14.5%	13.2%
calculated with a SD of 1:	13.4%	13.1%

HAZ

Standard Deviation SD: 1.60 1.48 1.21

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:	50.0%	49.7%	50.3%
calculated with current SD:	48.6%	47.8%	49.5%
calculated with a SD of 1:	47.7%	46.8%	49.4%

WAZ

Standard Deviation SD: 1.12 1.11 1.04

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:	37.9%	37.8%	37.7%
calculated with current SD:	40.3%	39.8%	39.4%
calculated with a SD of 1:	39.1%	38.8%	38.9%

Results for Shapiro-Wilk test for normally (Gaussian) distributed data:

WHZ	p= 0.000	p= 0.000	p= 0.000
HAZ	p= 0.000	p= 0.000	p= 0.004
WAZ	p= 0.000	p= 0.012	p= 0.056

(If $p < 0.05$ then the data are not normally distributed. If $p > 0.05$ you can consider the data normally distributed)

Skewness

WHZ	-0.27	0.06	-0.28
HAZ	0.46	0.64	0.01
WAZ	-0.18	-0.06	-0.11

If the value is:

- below minus 0.4 there is a relative excess of wasted/stunted/underweight subjects in the sample
- between minus 0.4 and minus 0.2, there may be a relative excess of wasted/stunted/underweight subjects in the sample.
- between minus 0.2 and plus 0.2, the distribution can be considered as symmetrical.
- between 0.2 and 0.4, there may be an excess of obese/tall/overweight subjects in the sample.
- above 0.4, there is an excess of obese/tall/overweight subjects in the sample

Kurtosis

WHZ	2.70	1.56	0.23
HAZ	4.38	2.43	-0.42
WAZ	0.93	0.49	-0.05

Kurtosis characterizes the relative size of the body versus the tails of the distribution. Positive kurtosis indicates relatively large tails and small body. Negative kurtosis indicates relatively large body and small tails.

If the absolute value is:

- above 0.4 it indicates a problem. There might have been a problem with data collection or sampling.
- between 0.2 and 0.4, the data may be affected with a problem.
- less than an absolute value of 0.2 the distribution can be considered as normal.

Test if cases are randomly distributed or aggregated over the clusters by calculation of the Index of Dispersion (ID) and comparison with the Poisson distribution for:

WHZ < -2: ID=1.60 (p=0.006)
WHZ < -3: ID=1.18 (p=0.191)
GAM: ID=1.60 (p=0.006)
SAM: ID=1.18 (p=0.191)
HAZ < -2: ID=1.71 (p=0.002)
HAZ < -3: ID=1.69 (p=0.003)
WAZ < -2: ID=2.31 (p=0.000)
WAZ < -3: ID=1.59 (p=0.007)

Subjects with SMART flags are excluded from this analysis.

The Index of Dispersion (ID) indicates the degree to which the cases are aggregated into certain clusters (the degree to which there are "pockets"). If the ID is less than 1 and $p > 0.95$ it indicates that the cases are UNIFORMLY distributed among the clusters. If the p value is between 0.05 and 0.95 the cases appear to be randomly distributed among the clusters, if ID is higher than 1 and p is less than 0.05 the cases are aggregated into certain cluster (there appear to be pockets of cases). If this is the case for Oedema but not for WHZ then aggregation of GAM and SAM cases is likely due to inclusion of oedematous cases in GAM and SAM estimates.

Are the data of the same quality at the beginning and the end of the clusters?

Evaluation of the SD for WHZ depending upon the order the cases are measured within each cluster (if one cluster per day is measured then this will be related to the time of the day the measurement is made).

Time point	0.8	0.9	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.1	2.2	2.3
